

Maintaining cyber hygiene is currently difficult, which can produce system vulnerabilities. The GAO (2020) estimates that approximately 90% of cyber-attacks are preventable through basic cyber hygiene and best practices.

Our goal is to increase the end-user's awareness of their cyber risk. This greater awareness will harden our systems against attacks by improving overall policy compliance.

**We have started developing  
the Cyber Hygiene  
Intelligence and Performance  
(CHIP) system.**
